# Inquisico

**Call for Interns 2023**

For the 3rd year running, we are calling for internship applications from undergraduate and postgraduate computer science students to work with us this coming summer.

Inquisico is a start-up based in Singapore incubated by Singapore Management University (SMU) https://iie.smu.edu.sg/startups providing clients predominantly with networking and infrastructure solutions. We found that most businesses do not have the expertise or the scale to deploy and maintain highly available applications and identity services (authentication and authorization). We plan to change that by extending our offering to provide infrastructure as a service (IaaS) and leverage cloud-native solutions.

If you are looking for a challenge, look no further. In this internship, you will be leveraging the latest technologies such as **Go**, **Vue.js**, **Docker**, and **Kubernetes**, plus witness the whole process of taking a plan from inception to production.

Project scope

In this project you will be working with automated deployment and cybersecurity systems. We are looking for two (2) interns, 1 frontend and 1 backend engineer to join us.

The backend API is predominately written in Golang and the frontend is written using Typescript and Vue.js. We will close the applications as soon as we find suitable candidates.

We looking for someone who has

- A good foundation in computer programming
- A strong learning attitude and self-motivation
- An obsession to write good, readable, and documented code
- Basic command of English
- Some experience in Golang or Vue.js would be good to have (but not required)

Benefits

Remuneration: **VND 8 Mil / Month**
Duration: **3 Months**
Location: **Anywhere in the world**

To apply, email internship@inquisico.com by 7 May 2023 with your resume and a recent academic transcript for an interview.

An internship report will be provided at the end of the internship. There is a possibility of an optional part-time role to maintain the application after the internship.
